

Cracking Rolls: Revisions are more cost-conscious

Cracking and smooth rolls wear out during use. This reduces the efficiency of the entire system when energy requirements increase. The revision of these rolls considerably improves the quality and efficiency of the mill process and is more cost-effective than a new purchase at a similar production level.

We are specialized factory builders. In our workshop, we maintain our own inspection station for all corrugation and smoothing cylinders. Thanks to the central location directly at the A1, we are within reach for each plant. Our highly efficient team works 7 days a week, 24 hours a day. Our objective is to operate when you lose the less production time.

✚ Machine park

For the corrugation or matting of your rolls we maintain a complete machinery park, which is operated by highly trained personnel.

✚ Advantages

Experience shows that the revised rolls offer the following advantages:

- uniform production at a high level of quality.
- Reduction of energy costs by up to 50 % increase in product efficiency.

✚ Short response time

Our particularity is the rapidity of reaction time. We also work at night, on weekends and on holidays, when the loss of production time is as short as possible.
